

Sammy Tech Online Store

Design and Implementation of an Online Internet and Starlink Accessories Store

Case Study: Sammy Tech, Juba, South Sudan

Smart solutions for a better tomorrow

The problem

Customers depend on physical visits, calls, and informal messages to ask about Internet equipment.

- Product availability and prices are difficult to check.
- Payment verification and order follow-up are not organized.
- Stock records and installation work are harder to manage manually.

Project goal

Build a practical online store that helps Sammy Tech sell Starlink kits, Internet devices, accessories, and installation services in Juba.

- Show products and real prices online.
- Support cart, checkout, payment, tracking, receipts, and installations.
- Give staff control over stock, orders, payments, and reports.

Technology used

PHP for application logic

MySQL for persistent business data

HTML, CSS, and JavaScript for the responsive interface

WAMP / Apache for local deployment

Session cart, secure staff authentication, and private payment-proof storage

Customer journey

1. Browse products and filter categories
2. Add multiple products to a session cart
3. Enter contact, pickup or delivery, and payment details
4. Receive an ST order number
5. Track status with order number plus phone number
6. Print a verified receipt

Payment policy

USD: cash or bank transfer

USD bank account: 2010111329047

SSP: cash only

Exchange reference: 1 USD = 7,800 SSP

The system saves the chosen currency, quoted amount, SSP rate, reference, and optional proof.

Staff operations

- Manage products, images, prices, categories, stock, and reorder levels.
- Review customer and delivery details before confirming an order.
- Confirming an order checks stock, deducts inventory, and records a stock movement.
- Cancelling a confirmed order restores stock automatically.
- Update payment status, schedule installations, run reports, and export order CSV files.

Security and reliability

Password hashing and staff-only pages

CSRF protection and server-side validation

Prepared SQL statements for user data

HttpOnly and SameSite session cookies

Login-attempt throttling

Payment proofs stored outside the public web folder

Health check for database, products, payment fields, logo, and exchange rate

Result and conclusion

Sammy Tech now has an organized digital workflow for selling Internet and Starlink equipment in Juba.

The system connects customer ordering with stock control, payment confirmation, installations, tracking, and reporting.

Future enhancements: payment gateway integration, SMS / WhatsApp notifications, customer accounts, and production HTTPS deployment.
